

Encryption Self-Classification Declaration

Application: Innawoods: Backcountry **Bundle Identifier:** com.innawoods.innawoods **Apple App ID:** 6777637554 **Developer:** Caravan Electric, LLC **Contact:** zack.caravan@gmail.com **Source:** <https://github.com/zackcaravan/innawoods> **Date:** 2026-06-19

Summary

Innawoods implements standard, published encryption algorithms for the purpose of end-to-end encryption of user data among consenting members of a private party. All algorithms are widely recognized as standard by international standard bodies (IETF). The software qualifies for the mass-market encryption exemption under **§740.17(b)(1)** of the U.S. Export Administration Regulations (EAR), Category 5 Part 2.

Encryption Algorithms Used

Purpose	Algorithm	Standard
Key exchange	X25519 (Curve25519 Diffie-Hellman)	IETF RFC 7748
Key derivation	HKDF with SHA-256	IETF RFC 5869
Authenticated encryption	XChaCha20-Poly1305	IETF RFC 8439 + draft-irtf-cfrg-xchacha-03
Transport (Apple OS)	TLS via URLSession / NSURLSession	Apple OS provided

No proprietary, non-standard, or custom cryptography is implemented.

Implementation

All cryptographic primitives are provided by the open-source `cryptography` package distributed via `pub.dev` (<https://pub.dev/packages/cryptography>), licensed Apache 2.0.

The application **does not** implement any cryptographic algorithm itself. It calls into the above third-party library and Apple's own Network framework (for TLS).

Purpose of Encryption

Innawoods is a privacy-first real-time GPS application for small private groups (parties) of off-grid users — hunters, hikers, riders, search-and-rescue volunteers. End-to-end encryption is used to seal:

- Live GPS position updates among party members
- Group chat messages
- User-placed map pins
- Multi-waypoint routes

The session key is derived per-party from a random 256-bit secret that travels in the URL fragment of the invite link, which the server never receives. The application server stores only opaque ciphertext.

Export Classification

ECCN: 5D992.c (Mass-market commodity; information security software that uses standard encryption for data privacy purposes)

Exemption Claimed: §740.17(b)(1) of the U.S. Export Administration Regulations.

Eligibility Basis:

1. The software performs standard cryptographic operations on information at rest and in transit.
2. The cryptographic functionality is ancillary to the primary purpose of the application (party coordination, not cryptography as a service).
3. The software is generally available to the public via the Apple App Store and Google Play Store.
4. The source code is published openly at <https://github.com/zackcaravan/innawoods> under the GNU AGPL-3.0 license — meeting the publicly-available criterion of §734.7 of the EAR.

This is the same exemption claimed by Signal, Bitwarden, Element, Standard Notes, Tailscale, and other mainstream end-to-end encrypted applications distributed through public app stores.

Annual Self-Classification Report

Caravan Electric, LLC will file the annual self-classification report required under §740.17(e)(3) of the EAR with the U.S. Bureau of Industry and Security (BIS) at crypt-supp2@bis.doc.gov and the National Security Agency (NSA) at enc@nsa.gov by **February 1, 2027** for the calendar year 2026.
